Cured-in-Place Pipe Solution

N-Liner has been created by New Hope Pipe Liners to provide a solution to aging pipeline. With over thirteen years of experience in the trenchless pipe line rehabilitation industry New Hope developed it to satisfy the needs of both the municipal and the industrial markets. N-Liner can accommodate sizes ranging from 4” through 108” and lengths of a few thousand feet, including size changes and irregular shapes.

N-Liner is a cured in place pipe lining system which consists of a polyester felt tube that has been saturated with a thermosetting resin. The saturated liner is inserted into the pipeline from a manhole and inverted to the next manhole or as far as may be necessary even up to a few thousand feet if required. All access is done through the manhole so no excavation is required and there is usually no disruption of traffic. The liner is formed against the interior of the host pipe and a heat source is applied to start the curing process of the resin. During the cure the temperature and pressure are monitored to ensure that the liner has cured. The liner is then cooled down and the laterals are reinstated using robotic cutters.

## Features and Benefits

Requires no excavation.	Eliminates tie ups and traffic delays.
Repairs pipelines of any material.	Structurally Sound Sizes form 4”-108”.
Manufactured in continuous lengths.	Eliminates groundwater infiltration.
Offers installation options.	Pull in, water or air inversion.
Chemical and abrasion resistant.	50+ years design life.
